

Welcome to the BSDCon/Euro 2023 presentation program.

(I)ntroduce, (O)verview or (P)resent? i

Setup a user? (enter a lower-case loginname, or 'no') [no] y

No really, what is the lower-case loginname, or 'no'? [no] kn

Full name? Klemens Nanni

Public email? kn@openbsd.org

# Overview

---

- Design Goals
- Modes / Features
- Examples
- Variable components
- How it works
- Build process
- Testing
- Recent changes
- Lessons learned
- Future ideas
- Questions

# Design Goals

---

- platform agnostic interface
- cover most common cases
- intuitive Q/A workflow
- great first impression
- reliable, resilient
- sane defaults

# Modes / Features

---

## ■ Installation & Upgrade

- interactive
  - ▶ mostly just <Enter>, <Enter>, ...
  - ▶ 'abort' / 'done' to track back
  - ▶ sets via disk, CD, NFS, HTTP(S) or FTP
- unattended (5s to interrupt)
  - ▶ install.conf via DHCP and HTTP - autoinstall(8)
  - ▶ custom sets and scripts - install.site(5)
  - ▶ /auto\_upgrade.conf - sysupgrade(8)

## ■ Rescue (S)hell

- debug network
- fix disks

# Examples

---

set default EFI entry plus backup in multiboot setup after upgrade

- /upgrade.site
- ```
mount /boot/
cp -a /usr/mdec/*.EFI /boot/efi/BOOT/
cp -a /usr/mdec/*.EFI /boot/efi/openbsd/
```

# Variable components

---

- **bootstrap** - sys/arch/\$(machine)/stand/, sys/stand/
  - biosboot(8/i386), pxeboot(8/amd64), boot\_sparc64(8/sparc64), etc.
  - floppy, CD, disk or netboot
  - software RAID support - softraid(4)
- **RAMDISK\*** kernel - sys/, etc/firmware/
  - WiFi, (network) drivers
  - NFS
- **userspace** - distrib/special/
  - minimum selection of SMALL builds
  - not every install media has
    - ▶ dhcpleased(8), kbd(8), ftp(1) TLS, etc.

# How it works

---

boot loader -> kernel -> init(8) (+ rc(8) stub) -> root shell

- `./profile` - glue code (~150 LOC)

- TTY and timeout setup
- mode selection
- `/install`, `/upgrade` or `/autoinstall` execution

- `/install.sub` - the centerpiece (~3700 LOC)

- helper functions
- questions / response file handling
- sysupgrade watchdog

- `/install.md` - machine dependent code

# Build process

---

## ■ install media - CD ISO, USB image) - mkhybrid(8)

- bootstrap - boot\_amd64(8/amd64)
- ramdisk (kernel + disk image) - makefs(8), rdsetroot(8)
  - ▶ all programs - crunchgen(8)
  - ▶ installer code - ksh(1)
  - ▶ firmware
  - ▶ sets
  - ▶ timezone data, TLS certs, /etc/ config, ...

## ■ release(8) or... boot media only without no sets

```
# cd /usr/src/ && make obj  
# cd distrib/  
# make -C special/  
# cd amd64/ramdisk_cd/  
# make
```

# Testing

---

- quick prototyping (no bootstrap)

```
# vmctl start -c -b obj/bsd.rd rd  
(I)nstall, (U)pgrade, (A)utoinstall or (S)hell? s
```

- introspection

```
# FUNCs_ONLY=1 ./install.sub  
  
# typeset -f get_dkdevs  
get_dkdevs() {  
    echo $(scan_disknames "${MDDKDEVS:-/[sw]d[0-9][0-9]* /s/.*/p}")  
}  
  
# get_dkdevs  
sd0 sd1  
  
# ed /install.sub
```

- install

```
# vmctl start -r obj/*.img ...
```

- use real hardware, please!

# Recent changes

---

- skip vlan and interface setup when there are none
- configure hostname.if(5) by lladdr/MAC
- better sets media default
- 'a' short for 'autoconf'
- Add new question to encrypt the root disk
  - required many fixes across the tree, idea from long ago
    - ▶ bootstrap, installboot(8), kernel, ioctl(8), regress, etc.
    - ▶ testing and feedback from others
    - ▶ may 2020: first commit in the series
    - ▶ aug 2022: first question (7.3 release)
    - ▶ aug 2023: reworked version

# Lessons learned

---

- more complicated than it looks
- smaller than it seems
- i386 floppy are a good measure
  - first to suffer from feature/size creep
- good phrasing is hard
- don't mess with muscle memory

# Future ideas

---

- more resilient questions, i.e. no need to restart an install
- make 'Setup user?' easier to get right ;)
- keydisk support (diff on tech@)
- UEFI multiboot awareness

Questions?
